

The new Smart Manual Nest (ASMN) shares most of the advantages of the automatic roll away community nest due to its unique design

Patented Design

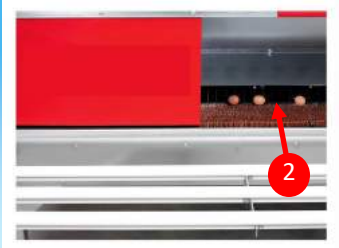

Features:

- Maximum production of high quality hatching eggs
- Minimum cracks in eggs
- Minimum floor eggs
- No need for bedding material, which can bring infection
- The eggs are collected from the central egg belt, a short distance to the egg belt, resulting in quick cooling of the eggs which reduces contamination
- The perforated eggbelt keeps the eggs apart to prevent cracking and breaking
- The eggbelt is made from plastic and is easy to clean
- The gentle sloping nest bottom ensures the eggs roll away quickly to the belt, so the eggs can cool down fast and remain cleaner
- The nest is made from Turfmat (as open mat) which means all dirt and manure particles can fall through, resulting in cleaner eggs.

1. The eggs collection belt has a special design to prevent eggs from falling during collection.

2. A simple system prevents eggs from rolling out during egg collection.

Early in the production period, the nest can be closed in the evening, so the birds will not learn to sleep or brood in the nest.

The nest can be automated if needed by removing the manual belt and adding an automatic belt with collection table. The nest can also be suspended.
